

3.0 credits	15.0 h + 15.0 h	1q
-------------	-----------------	----

Teacher(s) :	Peeters Daniel ; Ruiz Barrientos Patricio ;
Language :	Français
Place of the course	Louvain-la-Neuve
Main themes :	<p>Implementation of two complementary physico-chemical approaches for the forecast and the command of properties of matter</p> <p>Macroscopic properties and molecular interpretation</p> <ul style="list-style-type: none"> - Kinetics: Knowledge of fundamental laws regulating the progress of chemical reactions// Interpretation of kinetics experimental data to deduce reaction mechanisms. - Phase equilibria: Study of phase equilibria of condensed systems (liquid/liquid; liquid/solid) and of liquid/vapor systems with several constituents: interpretation and use of phase equilibrium diagrams // Thermodynamic study of nonideal systems with several constituents (solutions): use of thermodynamic tools for solving phase equilibrium problems. <p>Properties of particles and forecast of macroscopic properties - Statistical mechanics.</p> <p>Basic concepts // Application to gaseous systems // a priori calculations of thermodynamic quantities // Application to chemical free energy // Notions of non-equilibrium thermodynamics.</p>
Aims :	<p>Knowledge concerning the properties of matter and their understanding from the corpuscular/molecular scale.</p> <p>Know-how in physical chemistry: quantification, conceptualisation, modelling.</p> <p>Development of an adequate attitude towards the understanding of the properties of matter and their command.</p> <p><i>The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".</i></p>
Content :	<p>Contents:</p> <ul style="list-style-type: none"> - KINETICS: Rate of chemical reaction. Relationship with chemical thermodynamics. Rate equations of chemical processes. Activation energy. Reaction orders. Influence of temperature. Absolute reaction rates theory. Collision and transition state theory. Irreversible and reversible reactions. Parallel and consecutive reactions. Degeneration of orders. Catalytic reactions kinetics. Kinetics of polymer formation reactions. Chain reactions. - PHASE EQUILIBRIUM: Binary liquid-liquid, liquid-solid and liquid-vapor phase diagrams, ternary diagrams. Thermodynamics of nonideal and ideal solutions. Use of thermodynamic tools for the study of colligative properties of the diluted solutions (vapor pressure, boiling point, freezing point and osmotic pressure). STATISTICAL MECHANICS: Introduction and fundamental concepts. Kinetic theory and the equation of state of a gas. A priori calculation of thermodynamic quantities. Application to chemical equilibrium. Introduction to non-equilibrium thermodynamics. <p>Methods</p> <p>Courses and exercises concentrating on concrete use of the concepts.</p>
Cycle and year of study :	> Master [120] in Chemistry and Bio-industries
Faculty or entity in charge:	AGRO
