

8.0 credits	45.0 h + 45.0 h	2q
-------------	-----------------	----

Teacher(s) :	Gohy Jean-François ;
Language :	Français
Place of the course	Louvain-la-Neuve
Main themes :	This course will recall the prerequisites of the general chemistry which are of use in organic chemistry. The main concepts of the organic chemistry, necessary for a good understanding of biochemistry, will be introduced. Nomenclature, molecular structures, reaction mechanisms and stereochemistry of the basic compounds of organic chemistry will be explained. First links between these molecules and macromolecular biological compounds will be established.
Aims :	The aim of this course is to enable the student to manipulate the terminology, the molecular structures and the mechanistic schemes of organic chemistry with a sufficient ease. This needs to be considered in the introducing perspective of the biochemistry learning taking place during the second year. <i>The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".</i>
Content :	The course is divided in 3 parts: - An introduction recalls basic concepts: bond formation, isomerism, polarity and solubility relations, acids and bases. - In the second part, the organic functional groups, the reaction mechanisms and molecular structure, as well as the concepts of stereoisomerism are introduced. The compounds studied are alkanes and cycloalkanes, alkenes and alkynes, aromatic compounds, halogenated compounds, aldehydes and ketones, carboxylic acids and derivatives, amines. Substitution, addition, elimination and rearrangement are the most important mechanisms detailed during this section of the course. - In a third part, the acquired concepts are applied in several examples of molecules from the biology: sugars, amino acids and proteins.
Other infos :	Prerequisites: basic knowledge in general chemistry: atomistic, thermodynamic, acids bases reactions, redox reactions, pH and nomenclature. Support: syllabus made of teaching notes. Reference book: "Introduction à la chimie organique" by Hart and Conia, Interédition, Paris. Self-learning syllabus containing exercises, solutions and questions from recent examinations. Molecular models are available to help three-dimensional perception of organic chemistry aspects. A CD-rom contains overall cursus (including 3D animations) and a section of interactive self-learning.
Cycle and year of study :	<a href="#">&gt; Bachelor in Veterinary Medicine</a>
Faculty or entity in charge:	CHIM
