

5.0 credits	22.5 h + 7.5 h	2q
-------------	----------------	----

Teacher(s) :	Ringeval Christophe ;
Language :	Français
Place of the course	Louvain-la-Neuve
Main themes :	<p>The observed universe</p> <ul style="list-style-type: none"> <li>- Cosmological principle and kinematics</li> <li>- Dynamics of Friedmann-Lemaître space-time</li> <li>* Cosmological parameters and dark energy</li> <li>- Thermal history of the universe</li> <li>* Kinetic theory in curved space-time</li> <li>* Freeze-out of interactions and relics</li> <li>- Big-Bang-Nucleosynthesis</li> <li>* Abundance of light elements</li> <li>* Dark matter</li> </ul>
Aims :	<p>These lectures will introduce the students to the cosmological observations and theoretical models at the root of modern physical cosmology. In particular, we will show how the expansion of the universe and the relative abundances of the light nuclei can be predicted from the laws of Physics. While the agreements between these predictions and their actual measurements have validated the Big-Bang model of Friedmann and Lemaître, they now suggest the existence of new forms of matter and energy, referred to as "dark".</p> <p><i>The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".</i></p>
Cycle and year of study :	<a href="#">&gt; Master [120] in Physics</a>
Faculty or entity in charge:	PHYS
