

5.0 credits	22.5 h + 15.0 h	2q
-------------	-----------------	----

Teacher(s) :	Fussen Didier ;
Language :	Français
Place of the course	Louvain-la-Neuve
Prerequisites :	Elements of spectroscopy, optics, signal processing and inverse problems (linear algebra) are useful but not indispensable.
Main themes :	The Earth's geophysical system and the radiative transfer ; remote sensing from space ; data processing in space applications ; climatic variables and climatologies.
Aims :	To understand the general context of the geophysical frame and of the methods used in the assessment of ground and atmospheric climatic changes, with a focus on spatial techniques and applications. One aims to understand what is accessible to remote sounding from past and present experiences and to show the fundamentals of data processing. <i>The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".</i>
Evaluation methods :	Presentation (prepared) about remote sensing questions from a topics list
Teaching methods :	Lecture
Content :	-- Summary about the geophysical system and radiative transfer -- vertical structure of the atmosphere -- general atmospheric circulation, composition and chemistry -- solar irradiance and Earth's radiative budget -- light-matter interaction and multiple scattering: albedo, aerosols and clouds -- Observation methods -- observation geometry from space; emission and absorption, nadir and limb i. low altitude and sun-synchronous orbits ii. geographical coverage and spatial resolution -- spectrometers and imagers from UV up to millimetric waves i. UV-Vis-near infrared ii. infrared iii. micro-waves -- satellite altimetry i. ocean ii. ice iii. climate -- 30 years of space remote sensing: successes and future i. SAGE-ORA ii. ENVISAT-GOMOS iii. CRYOSAT iv. forthcoming missions et programs -- ground-based networks and space measurement validation -- Remote sensing data processing -- application domain: ranges and space-time resolution -- atmospheric corrections
