

Teacher(s) :	Mingeot Marie-Paule ; Delzenne Nathalie ;
Language :	Français
Place of the course	Bruxelles Woluwe
Main themes :	Sub-sections : - A. General aspects : physico-chemical aspects of biochemical processes (including enzyme kinetics and classification, bioenergetics); - B. Molecular Biology (in Eukarya) : from genes to active proteins (structure and regulation); interest of molecular biology in diagnosis and drug development. - C. Metabolism : description, regulation, and tissue specificity of key anabolic and catabolic pathways. - D. Integrated view of metabolic pathways in the whole organism; modulation in several (patho)physiological situations.
Aims :	1. To acquire fundamental knowledge in biochemistry (including molecular structures, bioenergetics, enzyme kinetics, molecular biology) and metabolism. 2. To include this knowledge in specific fields of pharmaceutical sciences (medicinal biochemistry, drug metabolism, pharmacology, toxicology, nutrition). 3. To acquire an integrative approach of metabolic regulation (relations between metabolic pathways, adaptation to specific physiological situations) 4. To evaluate the relevance of new techniques (molecular biology) in the discovery of drugs and new targets. <i>The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".</i>
Content :	A. Principles of chemistry applicable to biological processes. Concepts of molecular interactions, enzyme kinetics, and bioenergetics in the context of drug discovery (drug metabolism, signal transduction, synthetic peptides, development of enzyme inhibitors). B. Structure and functions of genes and nucleic acids; principles/regulation of gene expression and protein synthesis; gene and protein analysis; application of molecular biology-derived techniques in medicine and drug development C Description and regulation of carbohydrates, lipids, amino-acids , and nucleotides metabolism at the molecular, cellular and tissue level ; control of energy homeostasis; hormonal regulation and cell signaling; metabolic fluxes. D. Metabolic adaptation to physiological situations (such as nutritional status, stress ) ; illustration of inter-organs cooperation (liver, adipose tissue, muscle, brain ).  Practical laboratory exercises (enzymes kinetics, molecular biology) and seminars (use of reference book and website; oral presentation of case-study)
Other infos :	Other elements  Cellular biology ; organic and general chemistry.  Evaluation  Evaluation of experimental knowledge during the period of practical exercise. Written exam with questions integrating all aspects (A to D) .  Support  Notes including key figures, power point presentations, and summary of each chapter.  Ouvrages de référence ; sites internet et adresses d'organismes intéressants : Biochemical Pathways Eds Gerhard Michal. Wiley press
Cycle and year of study :	<a href="#">&gt; Preparatory year for Master in Biomedicine</a> <a href="#">&gt; Bachelor in Biomedicine</a>
Faculty or entity in charge:	FARM
