Les thèmes abordés couvrent les notions de base en probabilité (et probabilité conditionnelle) et les principales distributions des vecteurs aléatoires. Seront traités les concepts de l'indépendance et de la corrélation, ainsi que quelques notions des propriétés de grands nombres d'échantillon. En analyse statistique, la priorité est donnée au traitement de l'approche paramétrique (estimation des paramètres d'une distribution de probabilités) et aux méthodes d'inférence (tests d'hypothèses et intervalles de confiance). Les concepts statistiques sont appliqués aux problèmes spécifiques de l'analyse de variance (ANOVA) et de la régression (simple).3</p>
