

6.0 credits	52.5 h	2q
-------------	--------	----

Teacher(s) :	Hantson Philippe ;
Language :	Français
Place of the course	Bruxelles Woluwe
Prerequisites :	The student is supposed to have basic knowledge of anatomy, physiology and biochemistry. The material consists mainly of the slide presentations during the lessons.
Main themes :	The lessons are focusing on the important concept of target organ. The basis of the presentation will be the experience accumulated from the management of acutely poisoned patients (drug overdoses). For each main organ (brain, heart, lung...), the topic will be introduced by a clinical case. From the clinical manifestations, the pathophysiology will be discussed in depth. Criteria of severity will be defined for the most common toxins. Treatment will also be discussed, with a critical analysis of the use of the antidotes. In addition to the adverse effects of drugs, other aspects of environmental toxicology will be covered : exposures to toxic plants, animals, gases... Some illustrative situations are described (Seveso, nephrotoxicity due to herbal remedies).
Aims :	The objective of these lessons is to give to the student a general overview of the most common mechanisms of toxicity that could be observed in clinical medicine. A large variety of substances will be covered, including therapeutic drugs but also illicit substances. At the end of the formation, the student should be able to distinguish functional and lesional toxins. He should also be able to assess the responsibility of toxic agent in clinical manifestations. <i>The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".</i>
Evaluation methods :	The evaluation is made with a questionnaire with multiple choice questions and open questions.
Content :	content method : The following chapter's will be illustrated by clinical case : <ul style="list-style-type: none"> - Epidemiology of drug poisoning - Pharmacokinetics and toxicodynamics - Toxins inducing central nervous system disturbances : drug and illicit substance - Toxic causes of metabolic acidosis - Mechanisms of cardiotoxicity - Paracetamol-induced liver failure - Toxicity due to animals and plants - Carbon monoxide and cyanide poisoning
Cycle and year of study :	> Master [60] in Biomedicine > Master [120] in Biomedicine > Advanced master in Clinical Biology > Advanced Master in Forensic Medicine
Faculty or entity in charge:	SBIM
