2018

5 credits

Food technology (partim)

52.5 h

Q2

Teacher(s)	Cybulska Iwona coordinator ;Kather Axel ;					
Language :	English					
Place of the course	Louvain-la-Neuve					
Main themes	The goal of this course is to give the students the understanding of the technological value added during the food and beverage production process. The course shall lead the students to combine their basic knowledge of biochemistry, microbiology as well as energetic and environmental aspects with the technological possibilities to influence the creation of high quality food and beverages with respect to production costs, legislative restrictions as well as influences on the sustainability of the product. The course will therefore use the malting and brewing processes as model process to explicitly describe the different production steps from the raw material intake till the packaged products (unit operations for separation : sorting, filtration, decantation, centrifugation, distillation,' and conservation). In further lectures the gained knowledge will be applied to explain the analogies to other food processes and their specific differences (planned: meat, dairy, distilled products, fruits/vegetables). The students will further develop in their practical work process descriptions for these industries in a seminar style.					
Aims	The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".					
Evaluation methods	The evaluation of the learned content is done by the discussion and appraisal of the produced presentation and an oral or written exam					
Teaching methods	The course is based on powerpoint presentations with multimedia content (embedded movies) and completed by the presentation (and distribution for the trials) of raw materials, process aids, process equipment, and example systems. Elearning is not explicitly included.					
Content	 Introduction (development what is Food Technology, how to work scientifically and interpret results) Water technology Water and waste water treatment Water as raw material Sterilization technology Basics of cooling and refrigeration Basics of pasteurization and sterilization processes High pressure treatment of food Cereal technology The raw materials (mainly barley and wheat, but also corn, rice, sorghum, and others) Matting
