2018

Research seminar in demography

5 credits	30.0 h	Q1

Teacher(s)	Bocquier Philippe ;Rizzi Ester Lucia ;
Language :	French
Place of the course	Louvain-la-Neuve
Main themes	The seminar starts with an in-depth and detailed discussion on the research methods in social sciences: Method of synthesis of the literature definition of complex concepts, causality formulating hypotheses building of indicators, Each stage is considered according to three big approach data analysis: the statistical approach for the quantitative data stemming from big inquiries; the qualitative approach for the narrative data stemming from detailed conversations, from focuses group or from the participating observation; the mixed approach.
Aims	1 Around themes of (research) chosen by the students as their memoryfinal report of research, the workshop teaches the students to: - acquire a critical approach to scientific literature - define research questions based on the scientific literature - build conceptual frameworks - study thoroughly a population issue - improve their capacities in written and oral scientific communication. - - - - *The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".*
Evaluation methods	Individual assignments (total of 35 out of 100) must be delivered to professors via Moodle at the specified deadlines (ie the Monday preceding midnight), each day of delay reducing by one point the note: - prepare for a round table a presentation of 3 minutes: question, hypotheses, mention data and methods (not noted) - write a page presenting the research question, hypotheses, data and methods of the dissertation taking into account the remarks and the discussion of the previous session (4 pts) - summarize the metadata (4 pts) - present the advantages and disadvantages of your data by valuing their strengths (4 pts) - present your dependent variable in relation to the research question (4 pts) - present your independent variables considered in relation to the hypotheses of the research (4 pts) - present as an empirical schema the relationships between variables of a good reference article (4 pts) - present the possible interactions and the strategies to control them (4 pts) - by taking two articles for examples, present the method chosen to analyze your data (4 pts) - PPT presentation of the research project (3 pts) Oral presentations (total of 10 out of 100) will take place in the presence of students and professors. Evaluation criteria : - Reminder of the research question and hypotheses (2 pts) - Brief review of the methodological literature (2 pts) - Empirical causal diagram (2 pts) - Data Sources Considered (2 pts) - Data analysis methods envisaged (2 pts) - Answers to the questions and criticisms of the audience (1 pt bonus) The final written report (total of 55 out of 100): methodological chapter of your dissertation according to the same structure as the oral presentation. Evaluation criteria : - Compliance with the approach taught (10 pts) - Critical approach to the methodology (15 pts) - Originality and relevance of arguments (15 pts) - Clarity (written expression and sequence of ideas) (10 pts) - General presentation (titles, bibliography, graphics ...) (5 pts)

Teaching methods	- Introductory presentations provide general methodological principles for developing a demographic research project, illustrated with examples. - Using introductory presentations and appropriate references, students prepare written work for the next time (i.e. 9 intermediate works + oral presentation). - At each lecture, professors return to the work presented at the previous lecture by discussing their strengths and weaknesses. - The final oral presentation sets a deadline for the individual research work and help prepare the methodological chapter that will be the subject of the Master's dissertation.
Content	General objective: to relate research questions and hypotheses to data and method. Around the research themes chosen by the students for their research dissertation, and based on the review of the scientific literature, the seminar allows us to reflect on: - data: metadata (team, funding, country, timing, objectives, sampling, target population, type of interview, method of data collection, time needed to obtain data), questionnaire and database. - methods: adequacy with respect to hypotheses, assumptions and limits (selection effects, endogeneity of variables ...) - empirical model (causal diagram): choice of dependent and independent variables, hypotheses on the relationship between these variables. The aim of the seminar is indirectly to perfect the students' written and oral scientific communication. The seminar will focus on the stages of construction of the research methodology: - Identification of the research question and hypotheses (see LSPED2040 and LDEMO2130) - Identification of data sources - Identification of data analysis methods - Construction of an empirical causal schema
Inline resources	Presentations and other resources are available on MoodleUCL.
