Medical microbiolgy

4 credits

Q1

45.0 h

Teacher(s)	Kabamba-Mukadi Benoît ;Rodriguez-Villalobos Hector coordinator ;Simon Anne ;Verroken Alexia ;				
Language :	French				
Place of the course	Bruxelles Woluwe				
Prerequisites	The prerequisite(s) for this Teaching Unit (Unité d'enseignement – UE) for the programmes/courses that offer this Teaching Unit are specified at the end of this sheet.				
Main themes	The course comprises two parts, the first one reviewing the basic aspects of microbiology and infectious disease and the second one consisting of a systematic review of the human pathogens. The virology is considered separately from the bacteriology, the mycology and the parasitology. In the general bacteriology part, the host microbe relationship at the level of the individuals and of the populations is described as well as the basic principle of antimicrobial treatments and resistance. By the description of several paradigmatic examples, the student initiated to the various relationships which exist between the human body and the microbial world. Thereafter, the different peculiarities of infectious diseases according to anatomic sites are reviewed in details by describing th characteristics of the main micro-organisms implicated in pathologies of the respiratory tract, the urinary tract, th central nervous system, the digestive tract, the skin and mucosae, and the genital tract. Mycology and parasitology constitute two separate chapters as well as hospital epidemiology. In the general virology part, several aspects of basic virology necessary to the understanding of the pathologies, are approached as well as the main aspects of diagnosis and treatment of viral infections and viral vaccines. In the systematic part, individual virus are described with a priority to those which are frequently implicated or which cause a high morbidity or mortality in our population like hepatitis, SIDA or herpes viruses. A series of four sessions of practical exercices allow the students to practise basic techniques used in microbiology laboratories : microscopic examinations, bacterial cultures, identification microbial susceptibility testings and serological tests				
Aims	At the end of this course, the student should have acquired a general knowledge of the main micro- organisms (bacteria, viruses, parasites, fungi and helminths) implicated in human pathologies, including the main phenotypic and genotypic characteristics, the virulence factors, and the epidemiology. It should allow to understand the physiopathology, the diagnosis, the prevention and the basic principles of the treatment of the principal human infectious diseases. Technical aspects of the diagnosis and the treatment are not within the scope of this course.				
	The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".				
Content	Bacteriology, mycology, parasitology. General part : Host-pathogen relationship at the cellular and molecul levels : microbial ecology, virulence factors, genetic regulation. Vaccines design. Epidemiology of communi or hospital-acquired. infectious diseases. Basics of antimicrobial therapy. Systematic part general overview human microbial pathogens micro-organisms implicated in infection of the urinary tract; - micro-organisms implicated in infection of the centr nervous system; - micro-organisms implicated in infection of the digestive tract; - micro-organisms implicated infection of the sub-cutaneous tissues; - micro-organisms implicated in infection of the genital tract parasitology - mycology - helminthology Virology General part - structure, taxonomy, cycles - genetic variations elements of pathogeny - general aspects of diagnosis - immunisation and treatment Systematic part - herpes vir - hepatitis virus - retrovirus - picornavirus - paramyxovirus B19 - papovavirus - adenovirus - poxvirus - virus implicated in diarrhoea - rubella virus - orthomyxovirus - paramyxovirus - arbovirus, arenavirus and filovirus - rabies virus hantavirus				
Other infos	Method The course is made of a series of public lessons with a lot of illustrations. A specific textbook (syllabus is provided to the student. The textbook as well as the main slides shown during the courses are available or iCampus. (http://www.icampus.ucl.ac.be/MBLG1130/) A forum is open on iCampus : it allows the student to as questions about any problem encountered. A series of four sessions of practical exercises is organised during the year to allow the student to culture, identify and determine the susceptibility to antimicrobial agents of bacteria Prerequisite : Courses of General Biology and General Microbiology. Evaluation : written examination with open questions of short type.
