

In view of the health context linked to the spread of the coronavirus, the methods of organisation and evaluation of the learning units could be adapted in different situations; these possible new methods have been - or will be - communicated by the teachers to the students.

Q1

Teacher(s)	Charlier Jean-Christophe ;Louveaux Jérôme ;Oestges Claude ;
Language :	French
Place of the course	Louvain-la-Neuve
Prerequisites	This course assumes acquired the notions of mathematics and physics such as taught in the courses LEPL1101, LEPL1102, LEPL1105 , LEPL1201 et LEPL1202 <i>The prerequisite(s) for this Teaching Unit (Unité d'enseignement – UE) for the programmes/courses that offer this Teaching Unit are specified at the end of this sheet.</i>
Main themes	<p>The course deals with wave physics, with a special emphasis on electromagnetic waves. It starts by writing Maxwell's equations, followed by a derivation of the wave equation from Maxwell's equations or from classical mechanics, and discusses its general solutions. The characteristics of simple waves are presented (frequency, wavelength, Doppler effect, polarisation,...). The behaviour of waves at the interface between two systems is then studied (Snell's and Fresnel's equations). Interference phenomena, including diffraction, are presented for local point and extended sources. Standing waves are then considered, as well as wave packets. The generation of electromagnetic waves is finally discussed (antennas and oscillating dipoles).</p> <p>The second part of the course is an introduction to quantum physics: based on the notion of waves, it seeks to show the continuity and radical novelty of quantum physics compared to classical physics. It presents the limits of classical physics and the answer brought by quantum physics (wave-particle duality, Heisenberg uncertainty principle, Schrödinger equation), based on the concepts seen in the first part. It shows the interest of quantum physics in solving simple problems, and ends with a brief justification of the properties of atoms (hydrogen atom), providing a link to the notion of orbital necessary to understand chemistry and that of band structure used in solid-state physics.</p>
Aims	<i>The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".</i>
Evaluation methods	<p>Due to the COVID-19 crisis, the information in this section is particularly likely to change.</p> <p>Evaluation is based upon:</p> <ul style="list-style-type: none"> • a written exam at the end of the quadrimester • the mandatory participation to the laboratories • a mid-quadrimester interrogation (non necessarily certificative) • a public presentation by the students of their group work (APP or LABO) is also organized at the start of some lectures. <p>The students are provided for the exam (and the interrogation) with a reference formula sheet available for download on the course website.</p>
Teaching methods	<p>Due to the COVID-19 crisis, the information in this section is particularly likely to change.</p> <p>Lectures (CM).</p> <p>Learning based on exercises (APE), problems (APP) or laboratory (LABO) work by groups of students.</p>
Content	<p>Waves</p> <ol style="list-style-type: none"> 1.1. Displacement current' integrated approach of electromagnetism 1.2. Maxwell's equations and the wave equation 1.3. Solutions to the wave equation; mechanical waves 1.4. Polarization; reflection et refraction 1.5. Interferences 1.6. Diffraction 1.7. Standing waves and wave packets 1.8. Electromagnetic radiation and antennas <p>Quantum Physics</p> <ol style="list-style-type: none"> 2.1 Wave-particle duality, Heisenberg Uncertainty Principle

	<p>2.2 Schrödinger's equation and wave function</p> <p>2.3. Quantum particles, potential wells and the tunneling effect</p> <p>2.4. Hydrogen atom model and crystal band structure</p>
