

Due to the COVID-19 crisis, the information below is subject to change, in particular that concerning the teaching mode (presential, distance or in a comodal or hybrid format).

4 credits	20.0 h + 30.0 h	Q2
-----------	-----------------	----

Teacher(s)	Faux Pascaline ;
Language :	French
Place of the course	Tournai
Main themes	<p>This teaching unit provides an introduction to the understanding of the mechanical working of load-bearing structures and their analysis. It forms part of the continuous process of studying the main architectural structures. This teaching unit will provide the main concepts designed to:</p> <ul style="list-style-type: none"> • analyse simple linear structures by means of tools from statics and materials resistance. • maintain a dialogue with an engineer specialised in this field. • The following topics are covered: <ul style="list-style-type: none"> • Basic concepts in mechanics: force and moment • Characteristics of sections: centre of gravity, quadratics, main axes of inertia • Balance conditions of simple isostatic structures: hypotheses, force systems, support reactions • Internal loads and associated constraints: assessment and quantification • Mechanical properties of materials and deformation.
Aims	<p>Specific learning outcomes: By the end of the course, students are able to</p> <ul style="list-style-type: none"> • apply the fundamental principles of statics in the case of flat structures subject to the action of a system of forces. • produce the static diagram corresponding to a simple loaded structure. • use graphic methods applied to questions of statics, enabling the visualisation of forces understanding of their effects on the structure being studied. • use analytical instruments applied to the principle of balance of a flat structure, to the calculations of the reactions at the supports, to establishing internal loads and associated constraints. • undertake a critical analysis of simple extended, compressed or bent structures subject to usual loading. • formulate the mechanical properties of common materials - steel, wood, concrete and glass : law of behaviour, fragility and ductility. <p>1</p> <ul style="list-style-type: none"> • formulate the resistance conditions of a structure with regard to geometric factors and stress of the selected material. <p>Contribution to the learning outcomes reference framework: With regard to the learning outcomes reference framework of the Bachelor's degree in Architecture, this teaching unit contributes to the development, the acquisition and the assessment of the following learning outcomes:</p> <p>Make use of other subjects</p> <ul style="list-style-type: none"> • Interpret the knowledge of other subjects <p>Use the technical dimension</p> <ul style="list-style-type: none"> • Be familiar with and describe the main technical principles of building • Acquire an instinctive understanding of structures to use in producing a creative work of architecture <p>----- <i>The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".</i></p>
Teaching methods	Due to the COVID-19 crisis, the information in this section is particularly likely to change.
