

2.00 crédits

15.0 h

Langue d'enseignement	Anglais
Lieu du cours	Louvain-la-Neuve
Thèmes abordés	The course must cover the important and essential themes of the econometrics of time series analysis and their application in some fields of economics, like macroeconomics and finance. The basic concepts of stationarity and ergodicity are taught in the prerequisite course. The main themes for this course are those of linear time series models (autoregressive and moving average models), unit roots and cointegration. Both univariate and multivariate models must be taught. For non linear time series models, a selection of topics has to be done mainly among ARCH models, Markov-switching models, and state-space models. In all topics, the themes of model building, evaluation and prediction are included.
Acquis d'apprentissage	
Modes d'évaluation des acquis des étudiants	Students are expected to complete a take-home final project by themselves. The project will consist of both analytical and empirical questions.
Méthodes d'enseignement	Weekly lecture.
Contenu	<p>The course aims to find models that explain dynamical observations in economics. It considers the model-based method and attempts to infer model parameters by iteratively fitting observations with theoretical predictions from trial models. To this aim, it provides a necessary introduction to the basic theory of the following three types series: discrete-time Markov chain, continuous-time Markov chain, and continuous-time and continuous-state Markov processes.</p> <p>The structure of the course is given as follows (subject to change)</p> <ol style="list-style-type: none"> 1. Numerical methods 2. Stochastic numerical methods 3. Markov chains 4. Branching process 5. Continuous-time Markov chains 6. Birth and death processes 7. Continuous time Markov processes 8. Diffusion processes 9. Stochastic differential equations 10. Applications: competition, epidemic, population and spatial models
