

5.00 crédits	30.0 h + 30.0 h	Q1
--------------	-----------------	----

Enseignants	Chatelain Philippe ;Deleersnijder Eric ;Winckelmans Grégoire ;
Langue d'enseignement	Anglais
Lieu du cours	Louvain-la-Neuve
Préalables	Mécanique des fluides et transferts 1 [Imeca1321] or equivalent
Thèmes abordés	<ul style="list-style-type: none"> <li>• Compressible flows in ducts and nozzles</li> <li>• Incompressible flows in porous media</li> <li>• Potential flows</li> <li>• Introduction to transition, turbulence, and CFD</li> <li>• Introduction to geophysical and environmental flows</li> </ul>
Acquis d'apprentissage	<p><b>A la fin de cette unité d'enseignement, l'étudiant est capable de :</b></p> <p>In view of the LO frame of reference of the "Master Mechanical Engineering", this course contributes to the development, acquisition and evaluation of the following learning outcomes:</p> <p>LO1.1, LO1.2, LO1.3                  LO2.1, LO2.2, LO2.3, LO2.4, LO2.5                  LO3.1, LO3.2                  LO4.1, LO4.2, LO4.3, LO4.4                  LO5.4, LO5.5, LO5.6                  LO6.1, LO6.2</p> <p><b>Specific learning outcomes of the course</b></p> <p>At the end of this learning unit, the student will be able to:</p> <ul style="list-style-type: none"> <li>• Use the concepts and the associated equations of the simplified 1-D view, for compressible flows in ducts with friction, and in nozzles without friction, for various boundary conditions (reservoir and outlet); the acquisition and manipulations of the concept and equations being also supported by an experimental laboratory.</li> <li><sup>1</sup> • Apply the theory on flows in a porous media to various cases, linear and non-linear; also decide when non-linearity must be taken into account.</li> <li>• Manipulate the simple tools of 2-D potential flow theory to analyze various flows; also the flow past a circle and past an airfoil profile (obtained by transformation of a circle). Draw, using streamlines, flows with and without circulation, and exercise a critical view on the result, based on physics.</li> <li>• Comprehend the basic assumption of linear stability theory, the corresponding equations, and their application to the examples presented in class. Solve the equations in simple cases (e.g., for a piecewise linear flow). Comprehend the phenomenological description of the transition to turbulence.</li> <li>• Distinguish between the various scales of developed turbulence, also in terms of the energy spectrum (inertial range, dissipation range). Appreciate the impact on resolving scales in turbulent flows.</li> <li>• Comprehend the Reynolds averaging approach, also for shear flow, and the simple closure models of the RANS equations.</li> <li>• Use critical thinking when using a CFD software to compute a RANS solution of a case with medium geometrical complexity, also as supported by the Best Practice Guidelines (mesh quality, etc.).</li> <li>• Comprehend the specific dynamics of turbulent and stratified flows in a rotating reference frame, with specific applications to environmental and geophysical problems, thus enabling the students capable of engaging with researchers, practitioners and relevant officials.</li> </ul>
Modes d'évaluation des acquis des étudiants	voir la version en anglais
Méthodes d'enseignement	voir la version en anglais
Contenu	Compressible flows in ducts and nozzles <ul style="list-style-type: none"> <li>• Recall of the conservation equations (mass, momentum, energy).</li> </ul>

	<ul style="list-style-type: none"> <li>• Link between isentropic flows at moderate Mach number and ideal incompressible flows.</li> <li>• 1-D isentropic flow in a converging-diverging Laval nozzle (subsonic, supersonic), sonic conditions and maximum flow rate. Normal shock and jump relations. Operating modes of a nozzle.</li> <li>• 1-D flow in a duct with wall friction (Fanno).</li> </ul> <p>Incompressible flows in porous media</p> <ul style="list-style-type: none"> <li>• Linear case and model (Darcy).</li> <li>• Extended model for nonlinear case with some inertial effects.</li> <li>• Examples of applications (e.g., in rock physics, etc.).</li> </ul> <p>Potential flows</p> <ul style="list-style-type: none"> <li>• Point vortex, point source/sink, dipole.</li> <li>• Obtention of flows using a complex potential.</li> <li>• Flow past a circle: case without circulation; case with circulation and associated lift (Magnus effect) .</li> <li>• Flow past an airfoil and associated lift.</li> </ul> <p>Introduction to transition, turbulence, and CFD</p> <ul style="list-style-type: none"> <li>• Linear stability theory, and examples of application.</li> <li>• Phenomenology of the transition to turbulence.</li> <li>• Scales in developed turbulence: energy spectrum and dissipation (Kolmogorov).</li> <li>• Reynolds-Averaged Navier-Stokes (RANS) equations; also simplified for shear flows (boundary layer, jet, wake, shear layer).</li> <li>• Closure of the RANS equations and simple models, also near a wall.</li> <li>• Best Practice Guidelines, and hands-on sessions using a CFD solver.</li> </ul> <p>Introduction to geophysical and environmental flows</p> <ul style="list-style-type: none"> <li>• Time and space scales of variability.</li> <li>• Geohydrodynamic equations.</li> <li>• Turbulence, rotation and stratification.</li> <li>• Rigid lid and free surface approaches.</li> </ul> <p>Relevant case studies (e.g., Ekman boundary layer, 2D turbulence, contaminant transport, linear and nonlinear waves, etc.).</p>
