

Teacher(s)	Jonard François ;Vanclooster Marnik (coordinator) ;
Language :	French
Place of the course	Louvain-la-Neuve
Prerequisites	Probability and statistics Basic modelling course. Basic computer programming course.
Main themes	<p>The main objective of the course is to train students in the understanding of the challenges and the use of advanced methodologies for integrated water resources management.</p> <p>The topics that are covered are :</p> <ul style="list-style-type: none"> <li>- Concepts and challenges of integrated water resources management at different scales (local scale, watershed, country, region, international river basin, global).</li> <li>- Strategic, political and institutional aspects of integrated management of water resources. Introduction in current water policies (eg water policy for sustainable development).</li> <li>- Analytical tools for water management. Modelling of water resources systems (watersheds, reservoirs, perimeter, groundwater body) including technical, economic and social aspects. Analysis, planning, optimization and evaluation of water systems</li> </ul>
Learning outcomes	<p><b>At the end of this learning unit, the student is able to :</b></p> <ol style="list-style-type: none"> <li>a. Contribution de l'activité au référentiel AA (AA du programme) M2.2 ; M2.3 ; M2.4 ; M2.5</li> <li>b. Formulation spécifique pour cette activité des AA du programme (maximum 10) After the course, students should be able:                         <ul style="list-style-type: none"> <li>- to explain the concept of integrated water resources management (IWRM);</li> <li>- to explain the political, institutional , legal and policy issues associated with integrated water resources management;</li> <li>- to develop policies, strategies and programs for sustainable development of water resources;</li> <li>- to illustrate the international cooperation programs in the field of IWRM in international river basins (eg the Mekong, the Nile ... );</li> <li>- to model a hydro- system, while considering the random nature of the flow ;</li> <li>- to apply optimization methods ( dynamic programming, Lagrangian multipliers, linear programming, ... ) in simple IWRM planning problems;</li> <li>- to compare the performance of a hydro- system with multiple criteria and objectives formulated by different actors;</li> <li>- to develop a methodology to implement policies, strategies and IWRM programs.</li> </ul> </li> </ol>
Evaluation methods	<p>Theory: Oral examination with written preparation.</p> <p>Exercices: An assignment is transmitted to the students before the opening of the examination session. The student prepares a reply to the question and defend in an oral examintion. This exercice is evaluated by the assistant of the course.</p>
Teaching methods	<p>Theoretical course :</p> <ul style="list-style-type: none"> <li>• Lectures in audience. Due to lecture room capacity limitations related to the COVID crisis, some part of the course can be organised at distance.</li> <li>• Supported by video capsules</li> <li>• Support by online exercises (Moodle, Python Notebooks)</li> </ul> <p>Practical work: Exercises in the computer room.</p>
Content	<p>Part I: Issues, Strategic, Policy and Institutional Aspects</p> <ul style="list-style-type: none"> <li>• State of freshwater resources at the global and regional scales</li> <li>• Status of current uses and future needs for freshwater at the global and regional levels</li> <li>• State of water infrastructure and investment needs</li> <li>• Issues and challenges of the 21st century</li> </ul>

	<ul style="list-style-type: none"> <li>• Principles of Integrated Water Resources Management (IWRM)</li> <li>• Institutional, political and legal framework for water management</li> <li>• Elaboration of strategies and programmes for the management and development of water resources</li> <li>• International cooperation for water management. Examples of cooperation for water resources management: Mekong River / Nile River</li> </ul> <p>Part II: Modelling, Management and Optimization Tools</p> <ul style="list-style-type: none"> <li>• Aspects of Hydrosystem Modelling</li> <li>• Hydroinformatics and management. Contributions of remote sensing.</li> <li>• Programming, planning and optimization methods. Lagrangian multipliers. Linear programming. Dynamic programming.</li> <li>• Stochastic aspects. Uncertainty and sensitivity analysis. Water risk analysis.</li> <li>• Performance analysis. Multi-criteria and integrated water resources analysis.</li> </ul>
<p>Inline resources</p>	<p>Moodle</p> <ul style="list-style-type: none"> <li>• Cop of the presentations</li> <li>• Video capsules</li> <li>• Exercises (Python Notebooks)</li> <li>• Assignments for the practical work</li> <li>• Link to reference work (<a href="https://link.springer.com/book/10.1007/978-3-319-44234-1">https://link.springer.com/book/10.1007/978-3-319-44234-1</a>)</li> </ul>
<p>Bibliography</p>	<p>D. Loucks and E. Van Beek: Water Resources System Planning and Management: An introduction to methods, models and applications. UNESCO, 2005.</p>
<p>Other infos</p>	<p>This course can be given in English.</p>
<p>Faculty or entity in charge</p>	<p>AGRO</p>
