Advanced Econometrics - UCL

5.00 credits	30.0 h	Q2

Teacher(s)	Van Bellegem Sébastien ;
Language :	English
Place of the course	Louvain-la-Neuve
Prerequisites	Mathematics and Statistics for Economists
Main themes	The course must cover the basic most important topics of econometric theory at an advanced level. These themes concern econometric model formulation, estimation and testing. Teaching is at an advanced level. Proofs of important results are covered, though not systematically. Applications are also used so that students learn how to carry applications in their own research. Contents • Linear regression : exact finite sample theory of ordinary and generalized least squares • Large-sample theory: convergence concepts, stochastic processes (stationarity and ergodicitys, IID and white noise, martingales, martingale difference sequences) and limit theorems for IID and MDS). Application to large sample theory of least-squares estimation. • GMM and the method of instrumental variables • The method of maximum likelihood: (estimation and testing) and its application to linear regression and non-linear regression models. • Empirical applications. Use of an econometric and simulation/computational software.
Learning outcomes	**At the end of this learning unit, the student is able to :** 1 The purpose is that students acquire the basic tools of econometric research which are of general use in more specialized fields of research and which are covered in subsequent courses (Microeconometrics and Econometrics of Time-Series). An example of such a tool is the method of estimation by maximum likelihood.
Evaluation methods	Oral or written exam. A part of the final result is reserved for the evaluation of the exercises assigned during the term.
Bibliography	
Other infos	Support: A textbook like Hayashi Econometrics
Faculty or entity in charge	ECON
