Q2

Teacher(s)	Van Dyck Hans ;
Language :	English
Place of the course	Louvain-la-Neuve
Learning outcomes	
Evaluation methods	There is a written exam on the theoretical part of the course as well as on the individual practical part of the course (i.e. the book reading assignment) with open questions (comprehension questions).
Teaching methods	There is a theoretical part (classroom course with several interactions) and an individual book reading assignment. The choice of the 'classical' book in the field is imposed by the lecturer. Lectures are in english.
Content	This teaching unit consists in analyzing and understanding the current field of global change (climate change, generalized urbanization, deforestation, etc.). The expression "global changes" refers to all the changes that are observed on the scale of the entire planet. Changing demographics or the emergence of a generalized urban way of life are societal phenomena, while climate change or the accelerated loss of biodiversity relate to the environment. While most of these changes have their origin in the emergence of modern industrial society, some of them may be much older: overexploitation of land and the phenomena of erosion, even desertification, which accompany it are multi-millennial issues.
