

3.00 credits

22.5 h + 15.0 h

Q1

Teacher(s)	Jonard François ;Lambot Sébastien ;
Language :	English > French-friendly
Place of the course	Louvain-la-Neuve
Prerequisites	<ul style="list-style-type: none"> - Applied geomatics. - Soil physics
Main themes	<p>This course aims to teach technologies for characterization and monitoring of agroecosystems. In particular, geophysical imaging and characterization techniques of soil properties are presented, such as ground penetrating radar, electromagnetic induction or electrical tomography. Also, the course discusses the use of drones for environmental monitoring, including multispectral, thermal infrared, LiDAR sensors as well as photogrammetry. Fundamental concepts, instruments and methods of signal analysis will be particularly seen in-depth. The student will be made familiar with these tools through practical works and an integrated project.</p>
Learning outcomes	
Evaluation methods	<ul style="list-style-type: none"> - Written exam. - Integrated project report (by group). Weighting: 20% of the final mark if the written exam is passed. - Seminar evaluation (by group). The evaluation focuses on the quality and thoroughness of the presentation, the quality of the answers and arguments put forward during the debate, the communicative quality (quality of the slides, technical quality, oral expression). Weighting: 20% of the final mark if the written exam is passed.
Teaching methods	<ul style="list-style-type: none"> - Lectures. - Practical work in a team with an integrated project involving the production of a collective report. - Seminars allowing to deepen a scientific question related to the course and to develop the reading of the texts in English and the competence of professional communication.
Content	<p>The LBRES2101 course (4 credits) is the complete course. The LBRES2101A part (1 credit) is intended for students of the university certificate in applied geomatics and includes the subject relating to drones, drone sensors and photogrammetry. The LBRES2101B part (3 credits) does not include the part on environmental sensors and topographic tools.</p> <p>Full course content :</p> <p>Theoretical class :</p> <ul style="list-style-type: none"> - Geophysical techniques: ground penetrating radar, electromagnetic induction, radiometry, electrical tomography, seismic, reflectometry. - Drone remote sensing techniques: thermal infrared sensor, multispectral sensor, LiDAR. - Sensor networks - Signal processing methods: inversion, tomography, photogrammetry, data fusion, artificial neural networks. <p>Practical works :</p> <p>The main concepts presented during the courses will be applied during practical work sessions (operational skills) and an integrated project carried out by group.</p> <p>Seminars:</p> <p>Students analyze, synthesize and present a scientific article dealing with a scientific question relating to environmental monitoring.</p>
Inline resources	Moodle
Bibliography	<p>FR</p> <ul style="list-style-type: none"> - Diapositives du cours - Livres de référence recommandés. <p>EN</p> <ul style="list-style-type: none"> - Slides of the course - Recommended reference books.

Other infos	This course can be given in English. Part of this course (remote sensing by drone) is part of the University Certificate in Applied Geomatics accessible to professionals as part of continuing education.
Faculty or entity in charge	AGRO
