Nuclear thermal-hydraulics (Centre d'étude nucléaire-Mol)

5.00 credits	40.0 h + 7.5 h	Q1

Teacher(s)	Bartosiewicz Yann ;
Language :	English
Place of the course	Louvain-la-Neuve
Main themes	• Reactor heat generation • Transport equations (single-phase & two-phase flow) • Thermal analysis of fuel elements • (Single-phase fluid mechanics and heat transfer)'usually already known • Two-phase flow dynamics • Two-phase heat transfer • Single heated channel; steady state analysis • Single heated channel; transient analysis • Flow loops • Utilisation of established codes and introduction to advanced topics (modelling and thermalhydraulics for GEN4 reactors)
Learning outcomes	**At the end of this learning unit, the student is able to :** 1 • To be familiarised with various reactor types and their main design and operational characteristics • To learn how to estimate the volumetric heat generation rate in fission reactor cores under normal operation and shutdown conditions • To learn how to analyse the thermal performance of nuclear fuel elements • To learn the basic fluid mechanics of single phase reactor cooling systems • To learn to calculate pressure drop in reactor systems, including tube bundles, and spacer grids • To learn to analyse the heat transfer characteristics of single phase reactor cooling systems • To learn the basic fluid mechanics of two-phase systems, including flow regime maps, void-quality relations, pressure drop, and critical flow • To learn the fundamentals of boiling heat transfer, and its implications for reactor design • To learn the fundamentals of core thermal design, with attention to design uncertainty analysis and hot channel factors.
Evaluation methods	The evaluation is a combination of continuous and in-session exam. The continuous part is a project (team of 2) where the students have to set up a simulation tools to calculate the pressure drop (plus temperature, quality profiles) in a boiling channel under different conditions. The exam is written (in english), and assess both theoretical and practical leaning outcomes. Thus this exam is split according a theoretical part (closed book) and a practical part (opened book) The final mark is calculated as: • Project + pratical part of the exam (11/20) • Exam (9/20)
Teaching methods	• 30h of ex catedra lectures • 30h of partially-supervised personnal work (project) • 16h of supervised exercice sessions (exercice sessions) The course takes place at the Nuclear Research Centre of Belgium (SCK.CEN) in gthe framework of the BNEN interuniversity programme (see: http://bnen.sckcen.be). Courses taking place at SCK.CEN are condensed over a period of 2 intensive weeks of courses.
Content	• Lect. 1: Thermal design principles • Lect. 2: Reactor energy distribution • Lect. 3: Transport eqns. For 1-phase flow: Reminders/summary • Lect. 4: Tranport eqns. For 2-phase flows:basic formulation • Lect. 5: Tranport eqns. For 2-phase flows:equations • Lect. 6: Thermodynamics, cycles: non-flow and steady flow • Lect. 7: Thermodynamics, cycles: non steady flow first law • Lect. 8: Thermal analysis of fuel elements • Lect. 9: 1-phase fluid mechanics/heat transfer: Reminders/summary • Lect. 10: 2-phase fluid mechanics/pressure drops • Lect. 11: 2-phase fluid mechanics/pressure drops • Lect. 12: 2-phase heat transfer (pool boiling)

	• Lect. 13: 2-phase heat transfer (flow boiling) • Lect. 14: Single-heated channel: steady state analysis
