Methods & Models in Marketing

5.00 credits	30.0 h	Q2

Teacher(s)	Ducarroz Caroline ;Sinigaglia Nadia ;
Language :	French
Place of the course	Mons
Prerequisites	/
Main themes	This course does focus on advanced quantitative methods and models that can help face Marketing issues. Starting from these specific issues that a company/organization may face, a set of statistical/econometric methods and models are thoroughly presented. Case studies are linked to digital marketing.
Learning outcomes	**At the end of this learning unit, the student is able to :** **Competencies** Given the « competencies referential » linked to the LSM Master 120 in Management and in Business Engineering, this course mainly develops the following competencies: • 2. Knowledge and reasoning • 3. Scientific and systematic approach • 5. Work effectively in an international and multicultural environment • 6. Teamwork and leadership • 7. Project management 1 **Learning outcomes** At the end of this class, students will be able: • Identify the type of method/model that is adequate for a specific Marketing issue; • Understand the mechanisms behind the methods; • Model the issue; • Master a wide range of advanced statistical/econometric methods and tools that can be used to collect and analyze primary and secondary data. Students will be able to apply each of the methods/models to a real case (by using a software specialized in quantitative methods, SAS Enterprise Guide), and then to interpret the results and formulate managerial recommendations to the company/organization. • Work in an international setting, with US native speakers and practice online collaboration.
Evaluation methods	Students are evaluated by: • a **written exam** (**50% of the final grade - during the exam session - open questions**) mixing theoretical methodological questions and deep thinking on a real issue linked to digital marketing (case on computer – SAS Enterprise Guide software) ; during the exam session • their **report on the group project** (**Virtual Exchange – US and Belgian students mixed groups - 40% of the final grade - in English - to be handed in before the exam session);** • their **individual report (Virtual Exchange – 10% of the final grade - in English - to be handed in before the exam session***)* If the student did successfully pass the 3 evaluation activities, the integrated method mentioned above (written exam 50% - Team work 40% - Individual report 10%) will be applied. If the student got a failure grade on the written exam part, the final grade will be a failure (corresponding to the exam grade). ore information on the Virtual Exchange (group project report and individual report) will be provided during the first class session. In case the student fails the course, only the "written exam" part can be improved (the grades linked to the group project and the individual report remain unchanged for all exam sessions of the current academic year). Also, the professors may transform the written exam in an oral exam if less than 4 students are registered to the exam. In case the Virtual Exchange cannot be implemented, it will be replaced by a group project requesting a report linked to the group project and an individual report. In this case, the same integration method as the one described earlier will apply.

Teaching methods	Teaching methods and learning activities of this course are oriented toward: (i) learning the **methodological rigor** essential to use advanced statistical and econometric methods and models (rigorous knowledge and know-how); (ii) facing companies/organizations' reality through real **case studies**; (iii) facing challenges related to online collaborating with students from another country (USA), in a common project (**virtual exchange**).
	In concrete terms, sessions alternate lectures, discussions and case studies on real data linked to digital marketing. Each session is devoted to a specific model. From an issue faced by an existing company, a theoretical lecture is done and followed by an application on real data (case study and learning by problems), where students follow the process from A through Z (analyzing the issue, filtering useful information, choosing the method/model, analyzing data with **SAS Enterprise Guide**, analyzing results and making recommendations to the company). A last theoretical reminder is done
	Our **collaboration with the Appalachian State University (North Carolina, USA)** will have the students, grouped in mixed Belgian-US groups, work on a **common project (Virtual Exchange)** around the methods and models covered in class, in the context of a market study. New technologies will help them communicate. Students are expected to be available to communicate with US students, also outside classical class schedules (given US time difference) and during Easter weeks.
Content	This course makes students thoroughly think about how to model issues linked to marketing, and more specifically to digital marketing.
	More precisely, the main themes (which might slightly vary from one year to the next) are:
	• Measurement tools in Marketing
	* *Principal Component Analysis* * *Reliability analysis of a measurement scale*
	• Customer segmentation
	* *Clustering* * *Discriminant analysis*
	• Probability of belonging to a group
	* *Logistic regression (modelling)*
	• Perceived similarities between brands (in the context of a brand image study)
	* *Multi-dimensional scaling techniques (MDS)*
	• Experimentation in Marketing (design and data)
	* *ANOVA analysis (with moderation effects)*
Inline resources	Moodle (Student Corner)
Bibliography	**Support de cours** Le matériel pédagogique, à disposition des étudiants sur Moodle (Student Corner), est composé de : • Slides (écrans Power Point) • Etudes de cas • Informations nécessaires au Virtual Exchange **Références bibliographiques recommandées, lectures conseillées** : [1] CHURCHILL G., IACOBUCCI D.
