

Teacher(s)	Bol David ;
Language :	English > French-friendly
Place of the course	Louvain-la-Neuve
Prerequisites	LELEC 1530, LELEC2531 and LELEC2532. LELEC2650 strongly recommended
Main themes	<p>Over the last decades, integrated circuits have evolved from chips with a single function to complex systems on a single silicon chip. Such modern systems-on-chip (SoCs) features digital signal processors, microcontrollers, analog and RF circuits to provide the necessary interfaces to the physical world made of sensor signals, audio/video interfaces, electronic signals or wireless communications. These analog/mixed-signal (AMS) systems require the co-integration, co-design and co-verification of analog and digital circuits on the same CMOS technology platform. In this course, we will study the implementation of mixed analog/digital circuits with the help of behavioral modeling, as an essential tool within the design flow of AMS systems.</p> <p>This course concludes the ELEC formation in electronic circuits and systems.</p>
Learning outcomes	<p>At the end of this learning unit, the student is able to :</p> <p>a. <u>Contribution of the activity to the learning outcomes of the program</u> AA1 Knowledge base : electronic concepts (AA1.1), simulation and CAD tools (AA1.2) AA2 Engineering skills : analysis and modeling of an electronic system, AA3 R&D skills : find appropriate references on the existing solutions in the field of the course's project (AA3.1) AA4 Project management AA5 Communication skills : analysis and writing of a technical datasheet (AA5.3-5.5).</p> <p>b. <u>Learning outcomes</u></p> <p>After this course, the electrical engineers in circuit and systems should be able to:</p> <p>1</p> <ul style="list-style-type: none"> • critically compare analog and digital circuit solutions within a given applicative system context with respect to signal quality, power consumption, cost and flexibility, • analyze the sources and propagation of analog non-idealities into a mixed-signal chain, • generate appropriate abstractions for analog building blocks and model their behavior at high level in Verilog-AMS language, • setup an appropriate methodology for designing, simulating and verifying a mixed-signal system from specification phase to block partitioning to physical implementation, • co-simulate and co-verify analog blocks with a digital circuit in Verilog to mitigate the limitations of analog blocks and to extract specifications for the mixed-signal circuit implementation, • analyze industrial-level datasheets of an electronic system in the context of a design project , • analyze scientific-level papers in the field of electronic circuit and systems.
Evaluation methods	See the French version.
Teaching methods	<p>The course is composed of the following activities:</p> <ul style="list-style-type: none"> • lectures on the key AMS concepts, • assignment in groups for active learning with in-class kick-off and debriefing sessions. <p>This course addresses questions linked to sustainability and the socio-ecological transition through a 2-hour seminar on the societal consequences of the digitalization.</p>
Content	<ul style="list-style-type: none"> • Analog/mixed-signal (AMS) system design methodologies. • Behavioral analog modeling. • Analog non idealities and auto-compensation. • Digital assistance of analog circuits. • Modeling and implementation of phase-locked loops. • Modeling and implementation of systems based on sigma-delta modulation (if time allows).
