Probability and Statistics

Q2 5.00 credits 30.0 h + 30.0 h

This learning unit is not open to incoming exchange students!

Language :	French				
Place of the course	Charleroi				
Prerequisites	The necessary mathematical concepts are				
r roroquionoo	- first-order logic,				
	- set theory,				
	- To analyse :				
	functions of one or more real variables: derivation and integration				
	limits, sequences and series.				
	In terms of competence, it is necessary that students know how to perform a demonstration and ca				
	manipulate mathematical language in a formal way.				
	Prerequisites: LSINC1111, LSINC1112 and LSINC1113				
	The prerequisite(s) for this Teaching Unit (Unité d'enseignement – UE) for the programmes/courses that offer th Teaching Unit are specified at the end of this sheet.				
Main themes	The aim here is to obtain for the student a deep and exact understanding of the fundamental concept as well as training in probabilistic and statistical reasoning. The mathematical formalism is simplified by present. It is a question of using measurement theory in an intuitive way to extend the concept of countin towards an analytical definition of the laws of probability.				
	The basic subject of the calculation of probabilities is introduced by a few hours of descriptive statistic				
	(processing of a table of numbers, calculation of mean, variance, etc.) which give rise to practical exercise with R. The necessary principles of probability for an introduction to inferential statistics are also defined Particular emphasis will be placed on basic techniques, namely parameter estimation and hypothesitesting.				
Learning outcomes	At the end of this learning unit, the student is able to :				
	 to produce descriptive statistics and to pose a hypothesis test and solve it, in order to interpret the reality masked by the dataset, in function, to use the R language wisely to manipulate their data, use the foundations of combinatorial analysis and probability calculation to determine the probabilities associated with different events, to use the foundations of functional analysis, linear algebra and discrete mathematics to determine the probability laws of random phenomena, to manipulate the usual theoretical laws to explain behaviors, manipulate the laws associated with random variables studied simultaneously. 				
Evaluation methods	The final mark out of 20 is obtained at the end of an individual written examination, partly on a machine.				
Teaching methods	Theoretical lecture (30h), accompanied by exercise sessions (30h)				
Content	I Descriptive statistics 1				
	1 Univariate descriptive statistics				
	1.1 Analysis conditions				
	1.2 Graphical representations				
	1.3 Numerical characteristics .				
	2 Bivariate descriptive statistics				
	2.1 Analysis conditions				
	2.2 Graphical representations				
	2.3 The notion of link between two variables				
	2.4 Linear regression				
	II Probabilities				
	3 Combinatorial analysis				
	3.1 The Fundamental Counting Principle				
	3.2 The notion of arrangement				

3.3 The notion of permutation 3.4 The notion of combination 4 The calculation of probabilities 4.1 Fundamental set and event 4.2 An event is a set 4.3 Three axioms as a starting point 4.4 Probabilities on finite sets 4.5 Conditional probability 4.6 Independence 5 Random variables 5.1 Basic definitions 5.2 Discrete random variables 5.3 Continuous random variables 5.4 Generating function and Laplace transform 6 Usual probability laws 6.1 Bernoulli random variable 6.2 Binomial random variable 6.3 Poisson random variable 6.4 Geometric random variable 6.5 Negative binomial random variable 6.6 Hypergeometric random variable 6.6 Hypergeometric random variable 6.7 Discrete uniform random variable 6.9 Normal random variable 6.19 Roymal random variable 6.10 Exponential random variable 6.10 Exponential random variable 6.11 Erlang random variable 6.12 Approximation of a binomial distribution 6.13 Generating function and Laplace transform 7 Simultaneous random variables 7.1 Linked random variables 7.1 Linked random variables 7.2 Independent random variables 7.3 Sum of random variables 7.4 Conditional distributions 7.5 Limit theorems III Inferential statistics 8 Estimation theory 8.1 Point estimate	ı	2.2 The notion of permutation
