## ELME2M - Introduction

### Introduction

---

#### Introduction

The Master's degree programme in electro-mechanical engineering draws equally from two fields (mechanics and electricity) and prioritises basic knowledge with the goal of deepening or reorienting students' knowledge mid-career.

By the end of the programme, students will be able to keep up with technical developments and adapt themselves to the needs of the job market.

#### Your Profile

You

- Have solid knowledge of electricity and mechanics;
- Want to improve your understanding of current technological and scientific issues;
- Want to design, model, realise and validate experimental devices and systems;
- Want to specialise in mechatronics or in energy and foresee a career in robotics and "flexible production", energy transformation and management, vehicles and transportation systems and/or aeronautics.

#### Your Programme

This Master's degree offers:

- General knowledge of electro-mechanics based on research;
- The mastery of mathematical and physical methods used in electricity and mechanics;
- An interdisciplinary approach to problem solving with particular emphasis placed on interface problems;
- Pedagogy centred on project-based learning;
- The possibility of testing your knowledge in the job market thanks to internships in the industrial sector

Majors: Mechatronics; Energy

## ELME2M - Teaching profile

### Learning outcomes

Integrating the fields of mechanics and electricity is one of the major challenges of the civil engineering student in electro-mechanics.

The Master's degree in Electro-mechanical engineering from UCL favours multidisciplinary training and the ability to solve interface problems raised by the integration of several fields. It integrates the fields of electricity and mechanics into a coherent whole and prioritises basic knowledge with the aim of deepening or reorienting students' knowledge mid-career.

Students will acquire the knowledge and skills necessary to become:

- Specialists in mechatronics (electronics, mechanical production, automation and robotics) or specialists in energy (smart grids/ energy networks, thermodynamics and energy).
- Individuals with field experience capable of putting into practice their knowledge of research and technology.
- Managers who can manage team projects

The Master's degree programme in electro-mechanical engineering prepares its students to be aware of technical progress and adapt to the needs of the job market and changes in business.

Polytechnic and multidisciplinary, the training provided by the Louvain School of Engineering privileges the acquisition of knowledge that combines theory and practice and that is open to analysis, design, manufacturing, production, research and development and innovation all the while paying attention to ethics and sustainable development.

On successful completion of this programme, each student is able to :

1. Demonstrate mastery of a solid body of knowledge in basic science and engineering science allowing the student to learn and solve problems pertaining to electro-mechanics. (Axis 1)

1. Identify and use concepts, laws and appropriate reasoning from a variety of fields in mechanics and electricity to solve a given problem:

- Electricity (in the broad sense)
- Electrical energy (transport, quality, management)
- Electro-technics (conversion, controls, activation)
- Electronics (digital electronics, instrumentation)
- Automation
- Computer sciences (real time)
- Mechanics (modeling, design)
- Thermodynamics and thermics
- Fluid dynamics
- Robotics and automation.

2. Identify and use modelling and calculation tools to solve problems associated with the aforementioned fields.

3. Verify problem solving results especially with regard to orders of magnitude and/or units (in which the results are expressed).

2. Organize and carry out an applied engineering process to develop a product and/or service responding to a particular need or problem in the field of electro-mechanics. (Axis 2)

1. Analyse a problem, take stock of features and constraints, and formulate specifications in a field where the technical and economic limits are taken into account.

2. Model a problem and design one or more technical solutions (drawing on the fields of mechanics, electrics, electronics or information technology) and respond to problem specifications.

3. Evaluate and classify solutions with regards to all the specification criteria: efficiency, feasibility, ergonomic quality and environmental security (for example: too expensive, too complex, too dangerous, too difficult to manipulate).

4. Test a solution using a mock up, a prototype or a numerical model.

5. Formulate recommendations to improve a technical solution.

3. Organise and carry out a research project to learn about a physical phenomenon or a new problem relating to the field of electro-mechanics. (Axis 3)

1. Document and summarise the existing body of knowledge in the field of mechanics and electricity.

2. Suggest an experimental model or device (for example in the area of thermal regulation) by first constructing a mathematical model, then by using laboratories to create a device simulates system behaviour and tests relevant hypotheses.

3. Synthesize conclusions in a report that shows the key parameters and their influence on the behaviour of the phenomenon under study (choice of forms and materials, physio-chemical environment, conditions for use).

4. Contribute, through teamwork, to a multidisciplinary project and carry out the project while taking into account its objectives, resources, and constraints. (Axis 4)

1. Frame and explain the project's objectives taking into account the issues and constraints that characterise the project's environment.  
2. Collaborate with peers on a multidisciplinary topic (mechanics and electricity) to create a work schedule (and resolve any resulting conflicts).

3. Make team decisions to successfully complete the project whether they be about technical solutions or the division of labour.

5. Communicate effectively (speaking or writing in French or a foreign language) with the goal of carrying out assigned projects. (Axis 5)

1. Identify the clients' needs: question, listen and ensure the understanding of all the dimensions of the request and not just the technical aspects.

2. Present your arguments and convince your interlocutors (technicians, colleagues, clients, superiors) by adopting their language.

3. Communicate through graphics and diagrams: interpret a diagram, present work results, structure information.

4. Read and analyse different technical documents related to the profession (standards, drawings, specifications).

5. Draft written documents that take into account contextual requirements and social conventions.

6. Use modern communication techniques to give convincing oral presentations.

6. Display rigour, openness, and critical thinking; validate the socio-technical relevance of a hypothesis or a solution, all the while drawing upon available technological and scientific innovations. (Axis 6)

1. Apply standards and assure the robustness of a solution in the fields of mechanics and electricity.

2. Put solutions into perspective by including non-technical concerns (for example, in the area of energy and climate, take environmental and social factors into consideration).

3. Demonstrate critical thinking vis-à-vis technical solutions.

4. Evaluate one's own work.

## Programme structure

The student's programme includes:

- A common core curriculum (30 credits)
- A final specialisation (30 credits)
- One of more of the major courses or elective courses listed below.

The graduation project is normally completed in the second year. However, students may, depending on the nature of their project, choose to take their classes in the first or second year so long as their course prerequisites allow it. This is particularly the case for students completing part of their program abroad.

If during the student's previous studies, he or she has already taken a course that is part of the programme (either required or elective) or they have participated in an academic activity that is approved by the programme commission, the student may count this activity toward their graduation requirements (but only if they respect programme rules). The student will also verify that he/she has obtained the minimum number of credits requested for the approval of their diploma as well as for the approval of their major (in order to include their academic distinctions in the diploma supplement).

These types of programmes will be submitted for approval by the relevant Master's degree programme commission.

*For a programme-type, and regardless of the focus, options/or elective courses selected, this master will carry a minimum of 120 credits divided over two annual units, corresponding to 60 credits each.*

## OPTIONS

Students may select one of the majors suggested by the Master's degree programme in electrical or mechanical engineering provided that the courses in question are not already part of their course schedule. The following majors are highly recommended.

### MAJOR IN CIRCUITS AND ELECTRONIC SYSTEMS

The goal of this major (which it shares with Master's degree programs in electricity and electro-mechanics) is to introduce students to system design techniques, computer aided simulation, manufacturing and experimental characterisation of components and circuits (both analogue and numerical) as well as mixed systems. Emphasis is placed on practical applications and the completion of projects.

● Mandatory

△ Courses not taught during 2017-2018

**MAJOR IN MEMS & NEMS**

As with other Master's degree programmes in electrical or mechanical engineering, the major in micro and nanosystems seeks to introduce students to micro and nano manufacturing and design techniques, multi-physical simulation and the characterisation of micro and nano receptors and actuators in integrated technology. Given the applications of MEMS and NEMS in numerous sectors (automobile, telecommunications, electronics, households, medicine), the analysis of micro and nanostructures and the study of their behaviour is based on a multidisciplinary approach.

**MAJOR IN DYNAMIC S, ROBOTICS AND BIOMECHANICS**

The goal of this major (which it shares with Master's degree programs in electricity and electro-mechanics) is to give students a complete education in this field. All phases of the mechanical manufacturing process are studied from the design stage to putting manufacturing techniques into place to production planning and the organisation of workshops. In addition, students will learn about important technological techniques (machine parts) as well as solid mechanics (elasticity and plasticity) in order to master the processing, behaviour and use of common materials. Finally, attention is paid to methods used in the fields of automation and robotics.

## MAJOR IN NUCLEAR ENGINEERING

As with the Master's in civil electromechanical engineering with a specialization in energy as well as the Master's in civil and mechanical engineering, the goal of this major is to offer an in-depth education in the principal aspects of nuclear engineering. Entry into this programme, which is primarily overseen by the Mol Centre of Nuclear Energy, is contingent on an evaluation of candidates' skills based on the rules used for ERASMUS-SOCRATES exchange students. Further information about this major may be found on Mol's website SCK-CEN.

### ⊗ Alternative to the major in business risks and opportunities for computer science students

*Computer science students who have already taken courses in this field while pursuing their Bachelor's degree may choose between 16-20 credits from the courses offered in the management minor for computer sciences.*

**MAJOR IN SMALL AND MEDIUM SIZED BUSINESS CREATION**

In keeping with most of the Masters' degrees in civil engineering, the goal of this major is to familiarise the civil engineering student with the specifics of small and medium sized businesses, entrepreneurship, and business development in order to develop the necessary abilities, knowledge and tools to create a business. This major is reserved for a small number of students, selection of whom is based on a written application and individual interview. The written application must be submitted before the start of the academic year for Master's 1. Applications may be sent to: Secrétariat CPME-Place des Doyens, 1 1348 Louvain-la-Neuve (tel. 010/47 84 59) Selected students will replace their Master's thesis in the common core curriculum with a thesis related to business creation (the number of credits remaining the same).

### ⊗ Professional integration activity specific to the program

## Course prerequisites

---

A document entitled (nb: [not available](#) for this programme elme2m) specifies the activities (course units - CU) with one or more prerequisite(s) within the study programme, that is the CU whose learning outcomes must have been certified and for which the credits must have been granted by the jury before the student is authorised to sign up for that activity.

These activities are identified in the study programme: their title is followed by a yellow square.

As the prerequisites are a requirement of enrolment, there are none within a year of a course.

The prerequisites are defined for the CUs for different years and therefore influence the order in which the student can enrol in the programme's CUs.

In addition, when the panel validates a student's individual programme at the beginning of the year, it ensures the consistency of the individual programme:

- It can change a prerequisite into a corequisite within a single year (to allow studies to be continued with an adequate annual load);
- It can require the student to combine enrolment in two separate CUs it considers necessary for educational purposes.

For more information, please consult [regulation of studies and exams](#).

## The programme's courses and learning outcomes

---

For each UCL training programme, a [reference framework of learning outcomes](#) specifies the competences expected of every graduate on completion of the programme. You can see the contribution of each teaching unit to the programme's reference framework of learning outcomes in the document "In which teaching units are the competences and learning outcomes in the programme's reference framework developed and mastered by the student?"

## ELME2M - Information

## Admission

*General and specific admission requirements for this program must be satisfied at the time of enrolling at the university..*

## SUMMARY

- > [University Bachelors](#)
- > [Non university Bachelors](#)
- > [Holders of a 2nd cycle University degree](#)
- > [Holders of a non-University 2nd cycle degree](#)

## University Bachelors

Diploma	Special Requirements	Access	Remarks
<b>UCLouvain Bachelors</b>			
Bachelor in engineering	Major in mechanics with minor in electricity OR Major in electricity with minor in mechanics	Direct Access	
Bachelor in engineering		-	Students who have neither majored nor minored in the field of their civil engineering Master's degree, must submit a written application in which they list their detailed course curriculum (list of course work and marks year by year) to the programme commission. The commission will then suggest a programme in keeping with the student's previous course of study with the possible addition of a maximum of 15 supplemental credits.
<b>Others Bachelors of the French speaking Community of Belgium</b>			
Bachelor in engineering	With specific options in former institution related to electricity and mechanics	Direct Access	
<b>Bachelors of the Dutch speaking Community of Belgium</b>			
Bachelor in engineering	With specific options in former institution related to electricity and mechanics	-	
Bachelor in engineering		Access with additional training	Students who have no specialisation in electricity or mechanics must submit a written application to the programme commission in electricity or mechanics engineering in which they list their detailed course curriculum (list of course work and marks year by year). The jury will suggest a programme in keeping with the student's previous course of study with the possible addition of a

maximum of 15 supplemental credits.

Foreign Bachelors			
Bachelor in engineering	Bachelors from the Cluster network	Direct Access	Conditions imposed on UCL Engineering Bachelor
Bachelor in engineering	Other institutions	Based on application: accepted, conditional on further training, or refusal	Students will submit a written application for admission to EPL in which they list their detailed course curriculum (list of course work and marks year by year). The jury will determine whether the candidate may be admitted according to the regulations. Where necessary the jury may suggest a programme in keeping with the student's previous course of study with the possible addition of a maximum of 15 supplemental credits.

## Non university Bachelors

## Holders of a 2nd cycle University degree

Diploma	Special Requirements	Access	Remarks
<b>"Licenciés"</b>			
Engineers considered equivalent to corresponding bachelors		Direct Access	
<b>Masters</b>			
Masters in engineering		Direct Access	

## Holders of a non-University 2nd cycle degree

> Find out more about [links](https://uclouvain.be/fr/etudier/passerelles) (https://uclouvain.be/fr/etudier/passerelles) to the university

## Adults taking up their university training

> See the website [Valorisation des acquis de l'expérience](https://uclouvain.be/fr/etudier/vae) (https://uclouvain.be/fr/etudier/vae)

It is possible to gain admission to all masters courses via the validation of professional experience procedure.

## Access on the file

Reminder : all Masters (apart from Advanced Masters) are also accessible on file.

Students may submit an application for admission to the Louvain School of Engineering in which they list their detailed course curriculum (list of course work and marks year by year). The School in collaboration with the relevant programme commission will determine whether the student may be admitted and their decision will respect the programme rules. When necessary, they may suggest an individualised programme consisting of a part of the elective courses in the relevant Master's degree programme in civil engineering with the possible addition of a maximum of 15 supplemental credits.

The School in collaboration with the relevant programme commission will determine whether the student may be admitted and their decision will respect the programme rules. When necessary, the jury may suggest a programme in keeping with the student's previous course of study with the possible addition of a maximum of 15 supplemental credits.

## Admission and Enrolment Procedures for general registration

## Teaching method

The majority of classes consist of lectures and tutorials. The tutors are upper-class students who have specialised tutor training (the class LFS2351). This class provides its participants with practical tutoring techniques to help fellow students.

### Methods that promote multidisciplinary studies

UCL's Master's degree programme in electro-mechanics is by nature multidisciplinary because it combines classes in electricity, mechanics, automation and computer sciences. It also includes non-engineering elective classes such as economics, management and languages.

### Various teaching strategies

Through a pedagogy that prioritises projects that integrate several subjects, students gain critical thinking skills, which in turn allows them to design, model, and create electro-mechanic prototypes and systems.

In the last year of the programme, half of the time is devoted to the graduation project, which offers students the possibility of working as part of a research team or collaborating with the industrial sector to study a given subject in-depth. It provides an introduction to the actual working life of an engineer or researcher (thanks to the size of the project and the context within which it is carried out).

### Diverse learning situations

Various pedagogical approaches are used: lectures, projects, exercise sessions, problem solving sessions, case studies, experimental laboratories, computer simulations, educational software, internships in industry or research, factory visits, seminars and group as well as individual work. In certain subjects, eLearning allows students to learn at their own pace and carry out virtual experiments.

These diverse learning situations permit students to build their knowledge in an iterative and progressive manner all the while developing their independence, organisational and time management skills as well as their ability to communicate. Students have access to the newest information technology (materials, software, networks) during their studies.

## Evaluation

**The evaluation methods comply with the regulations concerning studies and exams (<https://uclouvain.be/fr/decouvrir/rgee.html>). More detailed explanation of the modalities specific to each learning unit are available on their description sheets under the heading "Learning outcomes evaluation method".**

Student work is evaluated according to University rules (see the [rules for evaluating coursework and exams](#)) namely written and oral exams, laboratory exams, individual or group work, public presentations of projects and theses defences.

### ELME Evaluation Methods

	Axis 1 et 2	Axis 3	Axis 3, 4, 5 et 6
Certificate-based evaluation	-End of the semester exam based on course exercises -Tests in some introductory classes	-Report on mini project in field of study -Progress report on multidisciplinary project	-Progress report on multidisciplinary project -Report, public presentation, and yearly work for graduation project
Formative evaluation	Tutor feedback in exercises-based classes and APP	-Tutor feedback in exercises-based classes and APP -Self-evaluation grid available	-Tutor feedback in exercises-based classes and APP -Work on oral communication portfolio of graduation project

The certificate-based evaluation for Axes 1 and 2 is mainly achieved through exams at the end of the semester. Exam questions primarily have to do with class exercises. This is in keeping with the description of skills and knowledge to be acquired by the end of the programme (see above).

For certain introductory classes given during the Bachelor's degree programme (BAC 12 and 13), a certificate-based test is given mid-semester. This test allows student assess their educational progress. This is notably the case for LMECA 1901 (continuum mechanics) or LELEC1370 (circuits and electrical measures).

The objectives of Axis 3 are achieved through disciplinary mini-projects carried out in small groups. Where applicable, the mini-project is evaluated and the mark is included in the student's final mark.

In certain instances, teaching is done through the Learning by Problem Solving method (Apprentissage par problèmes or APP); for example in the required course MECA2821. In this case the APP group reports contribute to the student's final mark.

The interdisciplinary projects LELME2002 or LELME2003 target the learning objectives in Axes 2-6. Their evaluation includes the continuous evaluation of the following skills: writing specifications, carrying out a mock up or preliminary project, writing a report, group work, planning group work, thesis defence before a jury, carrying out a project and choosing appropriate technical solutions.

The evaluation of the graduation project (TFE) is aligned with the learning outcomes in Axes 2-6.

In order to improve students' communication skills (Axis 5), practice presentations are organised about two months before the graduation project presentations.

The formative evaluation of Axis 6 is achieved in part during the projects required for LELME2002 or LELME 2003 via tutor feedback and above all during the graduation project. Given the nature of the graduation project, the topics outlined in Axes 6.2 and 6.3 are more or less accounted for.

For more information on evaluation methods, students may consult the relevant evaluation descriptions.

To obtain a passing grade, the marks received for the teaching units are offset by their respective credits.

## Mobility and/or Internationalisation outlook

Since its creation, the Louvain School of Engineering (EPL) has participated in diverse [exchange programs](#) that were put into place at the European level and beyond.

## Possible trainings at the end of the programme

### Specialised Master's Degrees

- Specialised Master's Degree in Nanotechnology
- [Specialised Master's Degree in Nuclear Engineering](#)
- Specialised Master's Degree in Biotechnology and Applied Biology

### Doctoral Programmes

Most doctoral students study at the Institute of Information and Communication Technologies, Electronics and Applied Mathematics as well as the Institute of Mechanics, Materials and Civil Engineering. The faculty of these Institutes participate in numerous doctoral programmes. A comprehensive list is available from the President of the Third Cycle Commission.

### UCL Master's degrees (about 60) are accessible to UCL Master's degree holders

For example:

- The [Master's degree \(120\) in sciences and environmental management](#) and the [Master's degree \(60\) in sciences and environmental management](#) (automatic admission with possible complementary coursework)
- Different [Master's degree programmes in management](#) (automatic admission based on written application): see this list
- The [Master's degree \(60\) in information and communication](#) at Louvain-la-Neuve or the [Master's degree \(60\) in information and communication](#) at Mons
