FSA

ELEC2880 **MODEM DESIGN**

[30h+30h exercises] 5 credits

This course is taught in the 2nd semester

Teacher(s): Piotr Sobieski, Luc Vandendorpe
Language: french
Level: 2nd cycle course

Aims

At the end of this lecture, the students will be able to

- use and understand, for a signal corrupted by additive white noise gaussian, the link between the signal, its analytical version, its complex envelope and the Rice components,
- use MATLAB to implement a filter in the previous formalism,
- expand a digitally modulated signal onto basis functions,
- derive the decision rule of an optimal receiver according to the Bayes criterion, for a digital modulation,
- establish and compute the bit error rate characterizing the coherent or noncoherent demodulation of a digital transmission corrupted by AWGN,
- explain "a priori" and "a posteriori" entropy,
- compute the entropy of a source and the Shannon channel capacity,
- from the maximum likelihood criterion, derive a Viterby equalizer,
- for a Wiener criterion, derive the equations to be fulfilled by a linear or decision feedback equalizer, and solve these equations,
- show the relevance of the matched filter by means of a fractionally spaced equalizer and apply this result to other systems,
- implement in MATLAB, Viterbi, linear and DF equalizers,
- explain from the ML criterion DA or NDA type phase estimators, and understand the tools to characterize the performance of these estimators,
- explain from the ML criterion, estimators for the sampling instant (timing recovery) of the DA and NDA types and explain their performance,
- understand and provide a mathematical description of multicarrier modulations, cyclic extension and explain the motivation for MC modulation.

Content and teaching methods

- Gaussian random signals
- Baseband representation for signals and systems
- Digital modulations with and without memory
- Modulation and demodulation in an AWGN channel, optimum receivers
- Information theory : entropy and Shannon capacity
- Detection : Viterbi equalization, linear and decision-feedback equalization, fractionally spaced equalization
- Synchronization : phase estimation (DA and NDA); timing recovery (DA and NDA)
- Multicarrier modulations : motivation, implementation with the (I) FFT, cyclic extension, need for coding

Other information (prerequisite, evaluation (assessment methods), course materials recommended readings, ...)

Teaching and learning method

Lectures interleaved with practical training possibly in computer room with MATLAB. A project about the performance computation of equalizers and/or synchronizers is proposed either.

Prerequisites

Telecommunications I (ELEC2360) and Telecommunications II (ELEC2795).

Assessment

Written examination based on exercises, with personal and lecture notes along with the evaluation of the project based on report, and oral discussion about obtained results.

Other credits in programs

ELEC22	Deuxième année du programme conduisant au grade d'ingénieur civil électricien	(5 credits)
ELEC23	Troisième année du programme conduisant au grade d'ingénieur civil électricien	(5 credits)
FSA3DA	Diplôme d'études approfondies en sciences appliquées	(5 credits)
