Pressure-based flow control

**Short description**: The LineUp Flow EZ™ is the most advanced system available for pressure-based flow control. The pump can achieve pressure from 1 to 7000 mbar. The compact device stands alone near the microfluidic setup, allowing the user to minimize bench space use without the need of a PC. One can be operational and generate data rapidly. This pump can be accessorised with a flow meter (from 1 to 80 µL/min) and a 2-positions switch. These can be controlled manually, or with a PC.
